All lenses are made with Focal Point Technology delivering exact reproducibility.

Essilor proprietary designs are manufactured using CEL Technology, a design process to enhance the fitting relationship of the posterior lens surface to the cornea.

ESSILOR *Surgical Series*

Post surgical lens designs are available in any Boston material

POSTGraft

This design can fit over many problems on the surface of the cornea. It fits from the outer portion of the cornea and can bridge over problem areas such as the graft margins of a penetrating keratoplasty, the edge of a Lasik optical zone, or even a scar on the cornea.

POSTLasik

The Lasik design is a spherical lens designed to provide excellent comfort and optimal visual acuity that comes from a well centered lens.

Limbal

This lens is designed to be used when there is a distortion of the cornea, such as pellucid marginal degeneration. The lens is fit large enough (10.8 to 11.2) to bring it to center with the optical zone rather large. This lens will usually produce the best optical situation that the patient has seen in a long time.

Jupiter

This is a tried and proven design to fit the cone and pellucid corneas that cannot be fit in the more standard designs. These are fit from trial sets.

ESSILOR *Multifocal Offerings*

Multifocal lens designs are available in virtually any lens material

ContinuVu

A lens design fashioned in the spirit of DeCarle while including outstanding intermediate qualities. ContinuVu has the range to go from low to high adds. It does need to translate to work at its best.

EZFocus

The back aspheric EZFocus is just that: a put-it-on simultaneous vision bifocal for low to midrange add situations. This is the easiest beginning bifocal and affords very good computer vision.

Read-Rite

This translating design is the defined-add bifocal for all adds that do not require intermediate correction (or are willing to sacrifice some intermediate for more near vision).

Distributed Designs

Blanchard Essentials, LifeStyle GP, Tangent Streak

ESSILOR *Keratoconus Series*

Keratoconus lens designs are available in virtually any lens material

KBA

The #1 cone design in Australia is available on every continent and exclusively from Essilor in the US. It's bi-aspheric design, large optic zone, and optimal apical clearance provides visual comfort & acuity.

BEGINNINGCone (or BCone)

This design is perfect for the emerging cone patient. It features a smaller optical zone and an aspheric periphery designed to give added lift to the periphery.

STANDARDCone (or SCone)

For 80% of your cone patients, our SCone design provides solid, predictable performance. This is an improved version of our popular CVC design and offers a small central optical zone to fit the cone, surrounded by a lens that is custom fit to the individual needs of the eye. The two areas of the lens are individually adjustable to provide the optimum fitting characteristics for both areas.

CUSTOMCone (or CCone)

This lens is a fully-customized lens design based upon your exacting specifications for even the most challenging patient.
